Representation Learning for Text: Word Embeddings

Luciano Barbosa

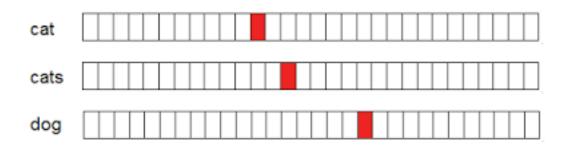

Motivation for Deep Learning

- In theory, feed forward networks with a single hidden layer can compute any function: no need for deep architectures
- However, learning shallow architectures is not always efficient
- Some problems require an exponential number of hidden units

Feature Representation in Text: One Hotel Encoding

- Each word mapped to a dimension and represented by a vector
- Example
 - $V = \{dog, bites, man\}$
 - $-D_1$: "dog bites man" = {[1,0,0],[0,1,0],[0,0,1]}
 - D_2 : "man bites dog" = {[0,0,1],[0,1,0],[1,0,0]}
- Dimensionality: size of vocabulary
- Naïve embedding
- Similar words have different representations

Feature Representation in Text: Bag of Words

- Each document represented by a vector
- Each dimension: a word with its respective weight
- Example
 - V = {the, cat, sat, on, hat, dog, ate, and}
 - $-D_1$: "the cat sat on the hat" = {2, 1, 1, 1, 1, 0, 0, 0}
 - $-D_2$: "the dog ate the cat and the hat" = {3, 1, 0, 0, 1, 1, 1, 1}
- Dimensionality: size of vocabulary
- Pros: Simple and very effective
- Cons:
 - Orderless
 - No notion of semantic similarity

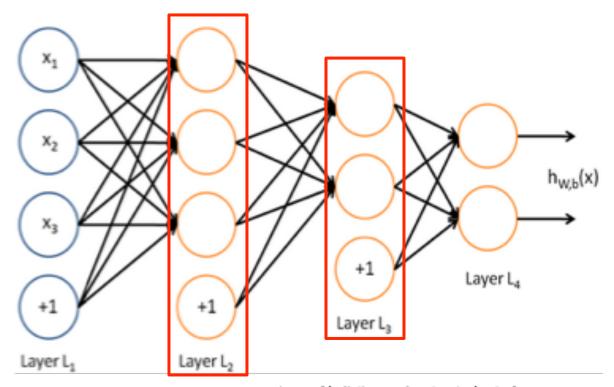

Representation Learning

- In ML models, instances are represented by their features
- Motivation:
 - Instance/data representation is essential for effective ML models
 - Less dependent on feature engineering
 - Dimensionality reduction
- Definition:
 - Set of techniques that learn a "better" representation from the raw data
- Distributed representation or embeddings
 - Dense and low dimensional representation
 - Dimensions have no meaning

Different levels of abstraction of the input

Img-Source: http://ufldl.stanford.edu/wiki/

Embeddings in NLP

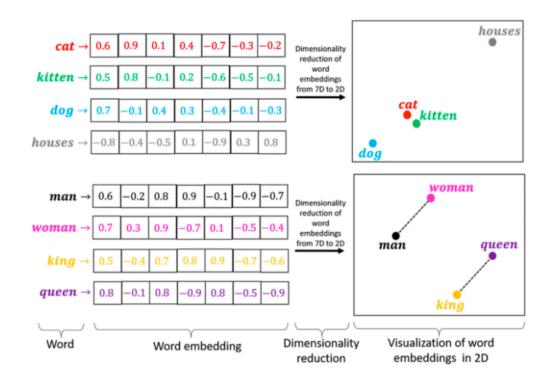

- Represent a linguistic unit as a dense vector
- Linguistic unit: character, word, sentence, document
- Map semantic meaning into a geometric space (embedding space)

Word Embeddings

- Embed the context of a word in a low-dimensional vector (e.g., 100, 200)
- Similar words are close in this space

Img-Source: https://medium.com/ @hari4om/word-embeddingd816f643140

Word Embeddings

- Built using dimensionality reduction techniques
 - Frequency based models (Latent Semantic Indexing)
 - Prediction based models (Neural networks)

Latent Semantic Indexing

- Build document and word representations
- Based on the co-occurrence of the words in the documents
- Dimensionality reduction: singular value decomposition (SVD)
 - $C = U\Sigma V^{T}$
 - C: term-document matrix
- Compute reduced C' with fewer dimensions

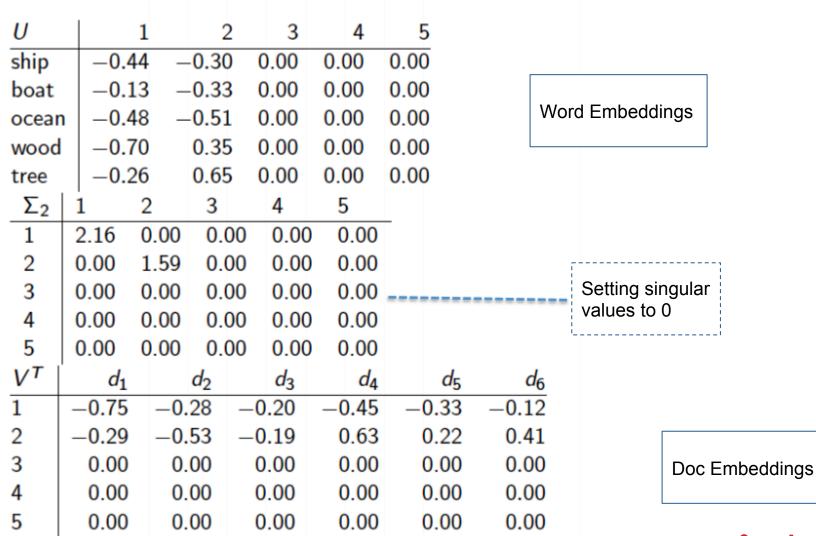

$C = U\Sigma V^{T}$

Reducing to 2 Dimensions

Projecting LSI Word Embeddings

Rohde et al., An Improved Model of Semantic Similarity Based on Lexical Co-Occurrence, 2005

Pros & Cons

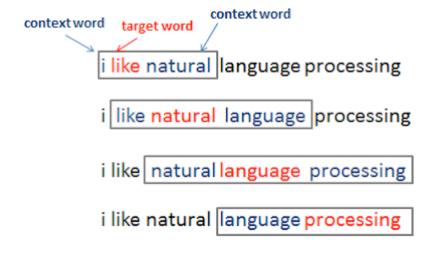

- Pros
 - Simple
 - Capture similarity
- Cons
 - Co-occurrence matrix is sparse
 - Quadratic cost (SVD)

Prediction Based Models: CBOW

Predicts word in the context (language modeling)

Img-Source:

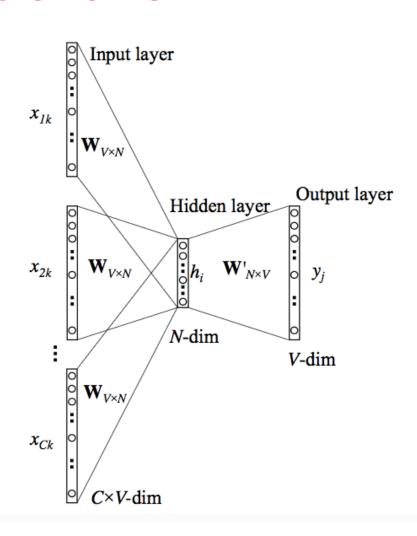

https://thinkinfi.com/continuous-bag-of-words-cbow-multi-word-model-how-it-works/

Prediction Based Models: CBOW

- Input:
 - Word context
 - Representation: one-hot e
- Output:
 - Probability distribution wrt
 - Size: vocabulary
- Hidden layer: embedo

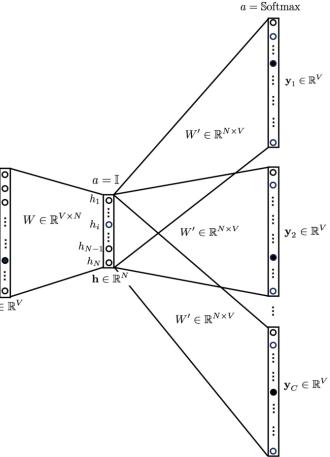

Img-Source: http://arxiv.org/pdf/ 1301.3781.pdf

Prediction Based Models: Skip-gram

- Predicts the context given a word
- Input:
 - Word
 - Representation: one-hot encoding x1 one-hot
- Output:
 - N Probability distributions
 - Size: context size (N) X vocabular $x_v = x_v \in \mathbb{R}^v$
- Hidden layer: embedding

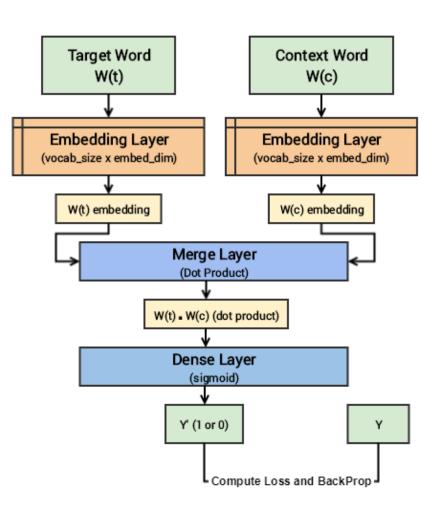

Img-Source: http://arxiv.org/pdf/ 1301.3781.pdf

Skip-gram with Negative Sampling

- Previous models are very costly
- Predicts words as neighbors
- Negative examples: words that a
- Inputs:
 - Word and its context word
 - Representation: one-hot encc
- Output:
 - Probability of matching

Img-Source: http://arxiv.org/pdf/

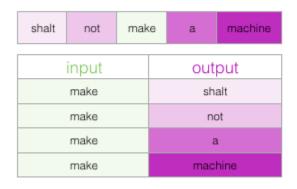

1301.3781.pdf

Skip-gram vs Negative Sampling

Existent Tools

- Demo:
 - https://rare-technologies.com/word2vec-tutorial/
- Word2Vec
 - https://code.google.com/p/word2vec/
- Doc2Vec
 - Learns dense representations for phrases, sentences and documents
 - https://groups.google.com/forum/#!topic/word2vec-toolkit/ Q49FIrNOQRo or Gensim
- GloVe:
 - http://nlp.stanford.edu/projects/glove/

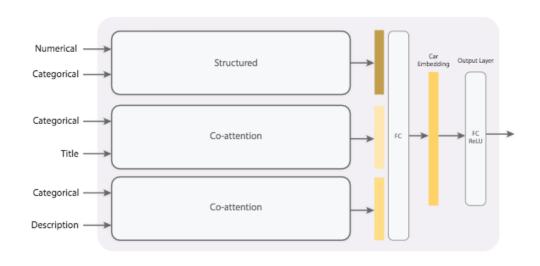

Impact of Word Embeddings

- In most networks for text, word embeddings are the basis
- Having good word embeddings increases significantly your performance
- Which is the best is hard to tell
 - Try all available
 - Use pre-trained vectors available (you can also create yours)
- Corpus selection and tuning the parameters for the task at hand
 - E.g. for sentiment, good and bad should be far away in vector space
